Product Name: Stand Alone Slip Table

Description: Oil Film Slip Tables, with integral reaction base, are the least costly alternative for horizontal testing. This design utilizes a precision granite slab and a magnesium slip plate for a low friction slip surface. This allows horizontal testing with any rotating shaker (old or new) capable of horizontal operation.

The stand alone reaction mass provides versatility in positioning and relocating test systems.

Features include: Diaphragm Oil Pump, Leveling Jack Screws & Self-Contained Oil Reservoir

Product Name: Combo-base Assembly

Description: The combined base is a unique approach, combining the shaker and slip table on a common platform. The concept uses a low profile steel frame to support the shaker trunnions and a Guided Oil Film Slip Table. The combined base can be outfitted with optional adjustable jack screws or air isolation mounts, V-groove wheels, or air casters. This complete assembly provides for consistent alignment between the shaker and table after repeated axis change.
